Major-Project Synopsis
6th Semester ISE-2026

Title	Chatbot-Based Intelligent Printing System with Queue and Payment Integration
Abstract	This project proposes a chatbot-based printer automation system that allows users to upload documents and configure print settings through natural language interaction. The system automatically analyses files, calculates printing costs, and manages print jobs using a queue-based mechanism. A payment gateway ensures secure payment before printing. The solution reduces manual intervention, minimizes errors, and improves efficiency in shared printing environments.
Objectives	● To build a chatbot interface for submitting and configuring print jobs. ● To automate document analysis and printing cost calculation. ● To manage print jobs using a secure queue-based system. ● To ensure payment verification before executing print jobs.
Methodology	The system uses a chatbot interface to collect user print requirements and accept document uploads. Uploaded files are automatically analysed to determine page count and printing parameters. Based on these inputs, the system calculates the total cost and processes payment through an integrated payment gateway. Upon successful payment, the print job is added to a queue and forwarded to a print server. The printer executes jobs sequentially while the system updates job status and notifications.
Proposed outcome	The proposed system will provide a user-friendly and automated printing solution using a conversational chatbot interface. It will enable accurate print configuration, transparent cost calculation, and secure payment processing. The queue-based print management will ensure efficient and orderly execution of print jobs. Overall, the system is expected to reduce manual effort, minimize printing errors, and improve user satisfaction in shared printing environments.
